

**EXEMPLO 6:** Calcula a concentración dunha disolución de oxalato de potasio,  $K_2C_2O_4$ , se se necesitan  $25,0\text{cm}^3$  da mesma para alcanzar o punto final con  $36,7\text{cm}^3$  dunha disolución aceda  $0,060\text{M}$  de  $KMnO_4$ . A reacción sen axustar é:

$$\frac{[C_2O_4^{-2}] \cdot V(C_2O_4^{-2})}{5} = \frac{[MnO_4^{-1}] \cdot V(MnO_4^{-1})}{2}$$

$$[C_2O_4^{-2}] = \frac{5 \cdot [MnO_4^{-1}] \cdot V(MnO_4^{-1})}{2 \cdot V(C_2O_4^{-2})}$$

$$[C_2O_4^{-2}] = \frac{5 \cdot 0,060\text{M} \cdot 36,7\text{mL}}{2 \cdot 25,0\text{mL}} = \underline{\underline{0,220\text{M}}}$$

Ou tamén:

$$n(MnO_4^{-1}) = [MnO_4^{-1}] \cdot V(MnO_4^{-1}) = 0,060\text{M} \cdot 0,0367\text{L} = 2,202 \cdot 10^{-3}\text{mol}$$

$$2,202 \cdot 10^{-3}\text{mol} MnO_4^{-1} \cdot \frac{5\text{mol} C_2O_4^{-2}}{2\text{mol} MnO_4^{-1}} = 5,51 \cdot 10^{-3}\text{mol} C_2O_4^{-2}$$

$$[C_2O_4^{-2}] = \frac{n(C_2O_4^{-2})}{V(C_2O_4^{-2})} = \frac{5,51 \cdot 10^{-3}\text{mol}}{0,025\text{L}} = \underline{\underline{0,220\text{M}}}$$
